Kintsu

Self-custody without the seed phrase, and without a single point of failure.

A Stellar wallet · HackMeridian 2026 Lisbon

GITHUB.COM/NSEGUIAS/KINTSU

Self-custody fails in two ways.

01 — THEFT

One device can spend everything

Phone wallets and browser extensions hold the full key. Compromise the device and the money is gone.

02 — LOSS

One piece of paper holds everything

A seed phrase is lost, thrown away, or photographed into the cloud. Lose it, and the money is gone too.

Either way, one mistake loses everything.

PROBLEM

Why now: AI makes every online device a target.

JULY 2026 · COLDCARD

A firmware bug made keys guessable

A weak random number generator let attackers drain thousands of wallets. Users who had added their own dice rolls were not affected.

THE LESSON

Two rules

1. Keys should come from the user, not only from a device.

2. Spending should need two separate devices, one of them offline.

Kintsu is built on both rules.

Kintsu removes both failure points.

No seed phrase: 3 NFC tags + a PIN

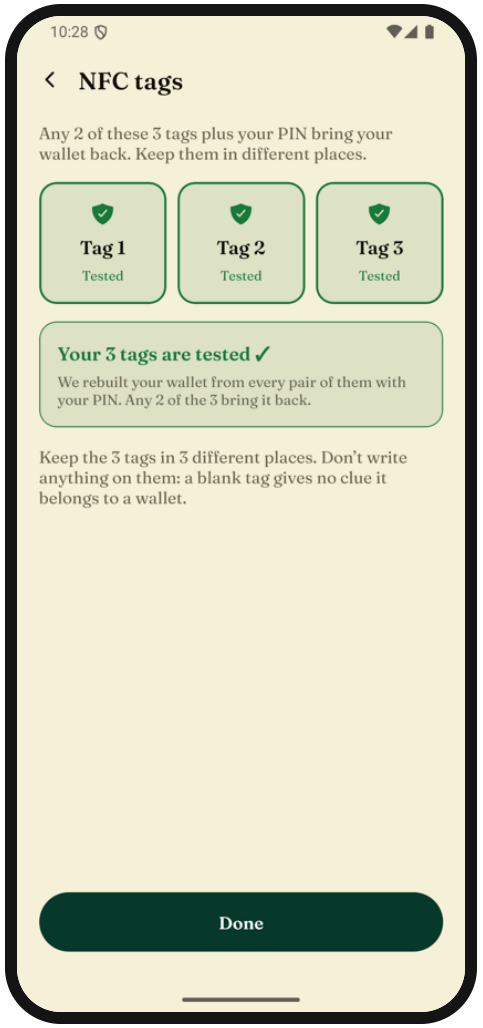

Any 2 tags restore the wallet. A single tag reveals nothing, not even that it belongs to a wallet.

No single device: an offline key approves payments

A stolen or hacked phone cannot move money without a tap of the user's hardware key.

Keys from the user

The wallet can be created from dice rolls or camera photos.

Who can do what

TO...	YOU NEED	NOT ENOUGH ON ITS OWN
Send or swap money	**Phone + key tap**	A stolen phone. A lost key.
Change who controls the wallet	**2 tags + PIN**	The phone and the key together.
Recover a lost phone	**2 tags + PIN**	One tag. The old phone is locked out.

Enforced by Stellar itself: no smart contract, no server, no custodian.

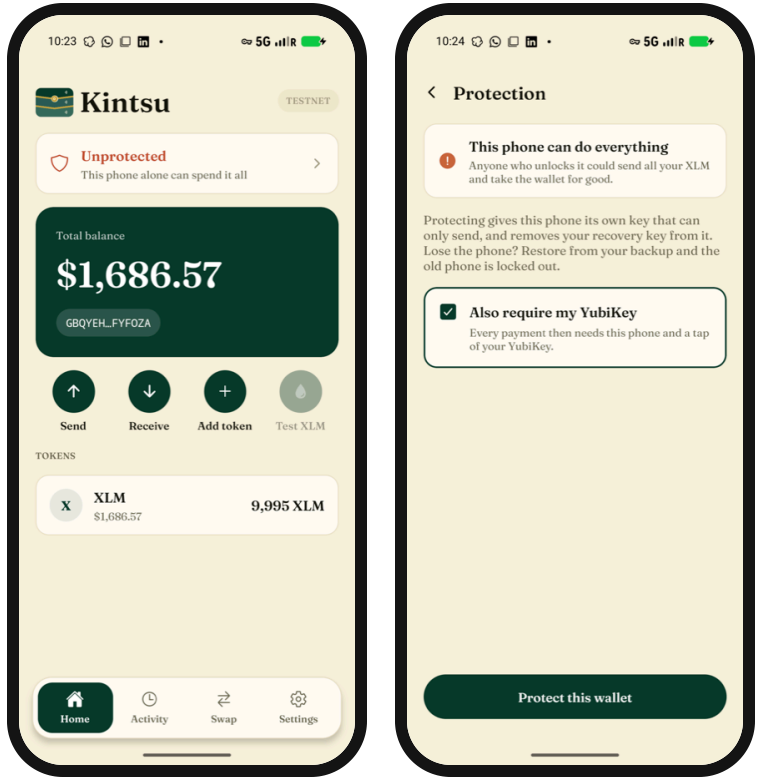

WHY STELLAR

Working today, on testnet and mainnet.

Built in 28 hours at HackMeridian, tested with a real Pixel, real NFC tags and a YubiKey

Stellar native: multi-signature accounts, built-in exchange, USDC and EURC

Audited crypto libraries only; Android APK on GitHub for judges

Try it: the APK runs without tags or a key, simulated.

Business model

HARDWARE

The Kintsu kit

3 tags and an offline key, sold together. Tags cost cents; the kit is the product people buy.

USAGE

Swap fee

A small fee on swaps through Stellar's built-in exchange.

PARTNERS

White-label

Stellar wallets and anchors add tag backup and hardware approval for their users.

Open-source app. Revenue from the kit, swaps and partners.

BUSINESS

Next 3 months

1

Security audit

Before real savings go in.

2

Mainnet launch

With the first 100 users and kits.

3

iPhone

NTAG216 tags, readable on iOS.

The ask: an SCF Build award to fund the audit and launch.
