A STELLAR WALLET · NO SINGLE POINT OF FAILURE

KINTSU

Distributed backups and 2FA for spending. Safer self-custody on Stellar.

PITCH STEP 01 / 04

THE SOLUTION

No single point of failure: distributed backups and 2FA for spending.

- **Distributed backups:** 3 NFC tags in 3 places. Any 2 + a PIN restore the wallet; one alone reveals nothing.
- **2FA for spending:** every payment needs the phone and a tap of an offline 2FA device.
- **Keys from you:** create the wallet from your own dice rolls or camera photos.

👉 **Result:** lose a tag or the phone and nothing is lost. A hacked phone can’t spend.

PITCH STEP 02 / 04

PMF

Self-custody fails in two ways: people lose access, or they get hacked.

- **Lost keys:** seed phrases get lost, thrown away or burned; phones break. The money is gone for good.
- **Hacks:** in July 2026 a Coldcard firmware bug let attackers drain thousands of wallets. Users who added their own dice rolls were safe.

👉 **Why now:** AI makes every online device a target. One device should never be enough.

PITCH STEP 03 / 04

TECHNICAL WORKFLOW

Stellar multisig: no smart contract, no server, no custodian.

- **Send or swap:** phone + 2FA tap. **Recover or change control:** 2 tags + PIN.
- Shamir 2-of-3 split, encrypted with the PIN. Audited crypto libraries only. DEX swaps, USDC and EURC.

👉 **Status:** working today on testnet and mainnet. Android APK on GitHub.

THE TEAM

Nahem Seguias

- Built Kintsu end to end in 28 hours at HackMeridian.
- App, cryptography, Stellar integration and design.
- Tested on a real Pixel with real NFC tags and a YubiKey.

👉 **Next:** security audit, mainnet launch, iPhone support.
