

Kintsu

A paperless Stellar wallet. Backed up to 3 NFC tags, with an offline 2FA device approving every payment.

PROBLEM

People lose crypto in two ways

They get hacked

AI is getting very good at finding bugs. Assume anything online will be hacked, phones included.

They lose their keys

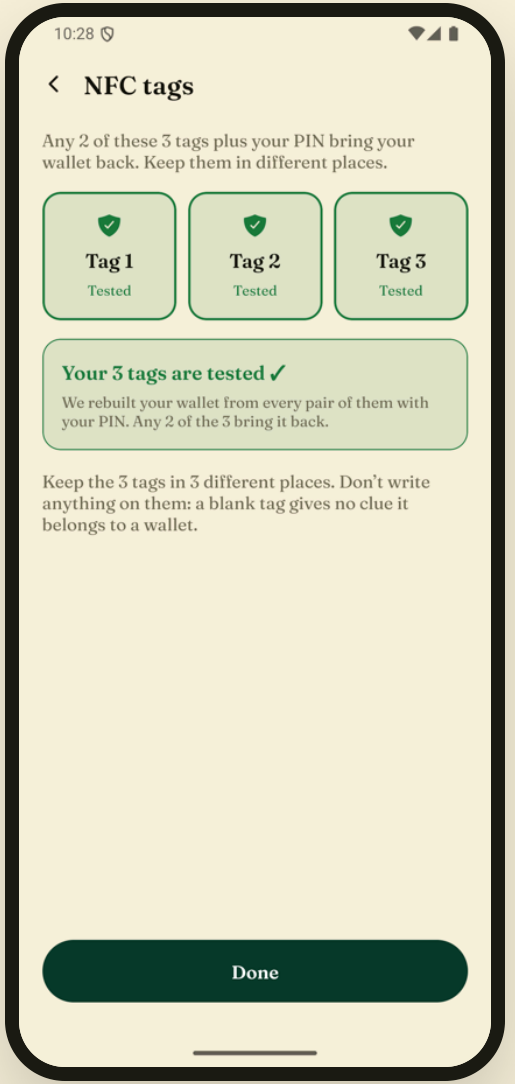

Seed phrases get lost, thrown away, or photographed into the cloud. One sheet of paper is a single point of failure.

July 2026: a random number bug in Coldcard firmware let attackers drain thousands of Bitcoin wallets. People who had rolled their own dice were safe.

SOLUTION

No seed phrase. No single device.

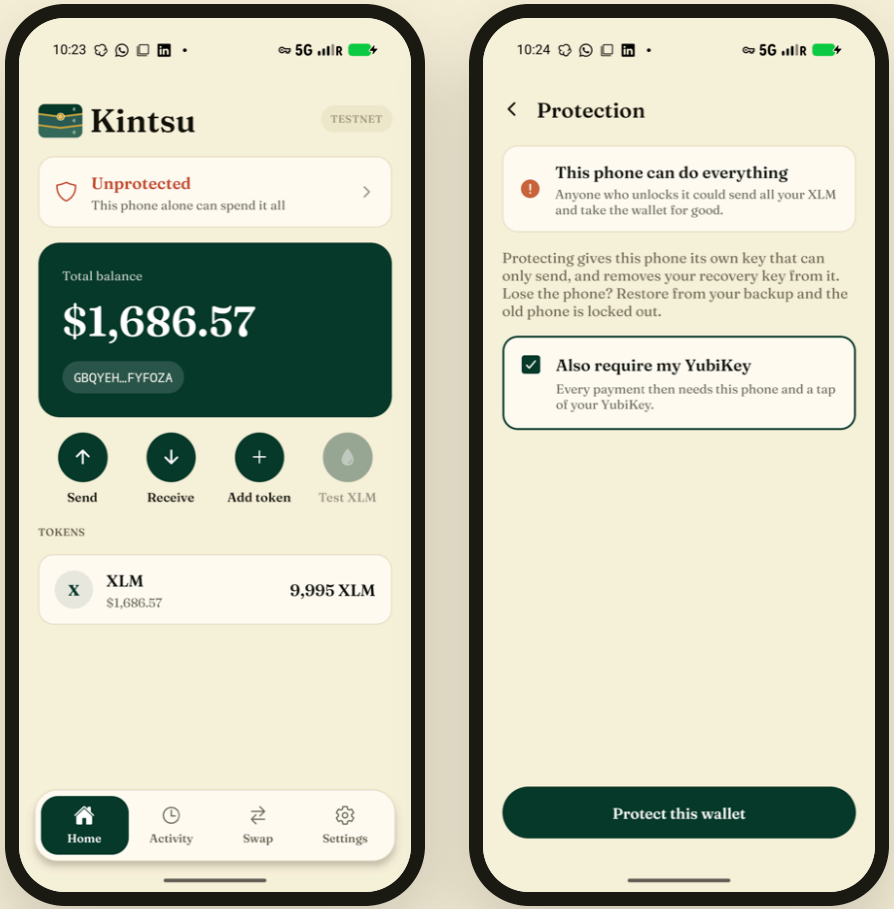

- **Your own randomness.** Create the wallet from dice rolls or your photos.
- **Paperless backup.** 3 NFC tags + a PIN. Any 2 bring the wallet back; 1 alone is random bytes.
- **Offline 2FA.** Every payment needs the phone and a tap of a hardware key.
- **Paper is optional,** for peace of mind.

DEMO · TESTNET

One flow, a few taps

- Create → PIN → write 3 tags, each read back and checked
- Test the tags: the app rebuilds the wallet from every pair
- Home warns while the phone alone can spend
- Protect: one Stellar transaction moves spending to phone + YubiKey
- Swap and send, each signed with a YubiKey tap

HOW · STELLAR

Native multisig does the hard part

Recovery key (2 of 3 tags + PIN)	**5**
Phone key	**2**
2FA device (YubiKey today)	**1**

Pay needs **3**: phone + 2FA. Change signers needs **5**: only the tags.

A stolen phone (2) or a lost YubiKey (1) is never enough.

Stellar features used

- Signer weights & thresholds
- SEP-5 key derivation
- Path payments on the DEX
- USDC / EURC trustlines
- Horizon, RPC, Friendbot

UNDER THE HOOD

Each tag is useless on its own

Tag format

Shamir 2-of-3 split, each piece encrypted with XChaCha20-Poly1305 and a scrypt-hardened PIN. 95 bytes, no labels: a tag doesn't say it's a wallet, whose it is, or which piece it holds.

Audited libraries only

@scure/bip39, @noble/hashes, @noble/ciphers, shamir-secret-sharing, OpenSSL scrypt, stellar-sdk. Pinned versions, tested against official vectors.

BUILT THIS WEEKEND

From idea to a working wallet in 28 hours

- Wallet creation from dice, photos or the phone; import and restore
- NFC tag backup with read-back and a full recovery test
- Stellar multisig protection with a YubiKey over NFC
- Send, receive, swap, tokens, activity, testnet and mainnet
- Tested on a real Pixel with real tags and a YubiKey 5 NFC

MARKET & NEXT

Who it's for

- People who hold real money and fear losing it
- Anyone who never wants to store a seed phrase
- Families and small teams on Stellar USDC

Path to mainnet

- Already runs on mainnet, in beta
- Security audit
- iPhone support with NTAG216 tags
- More offline 2FA devices

Your keys, in pieces only you can put back together.
